TWO COLOR ALUMINUM WINDOWS BY

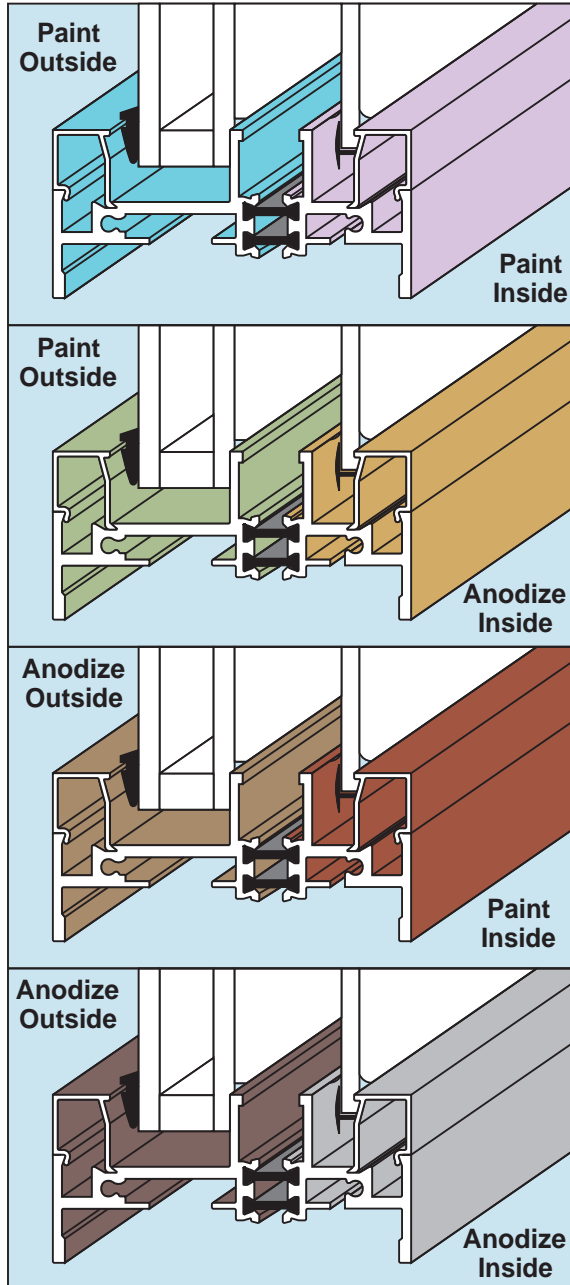

J. SUSSMAN, INC.

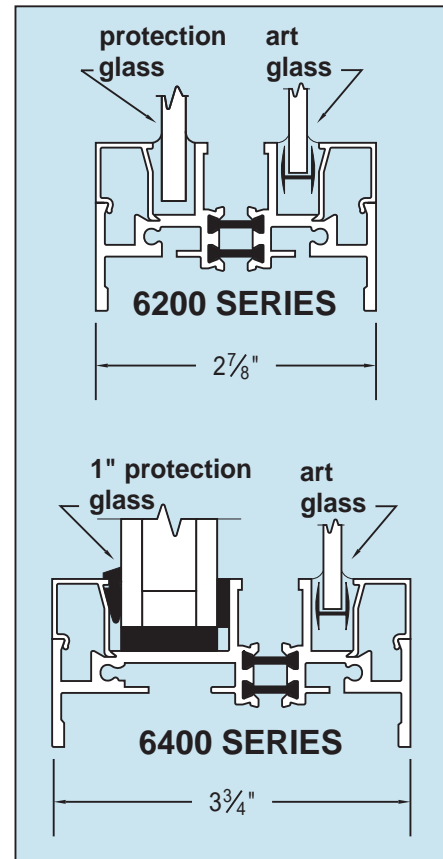

Since 1906

America's Finest Custom Church Windows

POSSIBLE COMBINATIONS

- The thermal strip is a specially formulated and constructed extrusion of glass fiber reinforced 6/6 polyamide nylon. Besides being thermally efficient, these high strength strips have the same coefficient of expansion as aluminum so that the structural integrity of the window is intact.
- The width of the thermal strip can vary to increase the thermal efficiency, reduce noise transmission and increase the depth and strength of the window.
- This time tested and proven system has shown no ill effects when exposed to various cleaners and detergents normally associated with the fenestration industry.
- This system is currently available in two different series of windows. One series is for art glass and monolithic protection glass and one is for art glass and insulated protection glass.
